Performance highlights GBP – Q3 2026

Market Review

Equity markets ground higher in Q3, and the MSCI World index rose by around 1.6% in Sterling terms, though the period was marked by very narrow leadership through the technology sector. To put this in perspective, the US S&P500 technology sector index was up 8.5%, whereas the same index 'ex-technology' was down 1.1% over the piece. Continued supply issues in the Strait of Hormuz pushed up the price of a barrel of Brent Crude from $73 to $103 over the quarter and that in turn pushed inflation and interest rate expectations concerningly higher.

Unsurprisingly, oil investments performed well, and the UK FTSE 100 equity index, with an outsized exposure to oil companies, also provided modestly positive returns, whilst by contrast European equities in particular suffered from the attendant rise in natural gas prices, Japanese equities led the pack in Sterling terms, primarily a result of Yen strength versus the Pound. Bond markets were broadly weaker, impacted by rising interest rate expectations and concerns about elevated fiscal deficits.

Performance overview

Additional risk was rewarded in the GBP MPS range over Q3, reflecting the outperformance of equities. The defensive, cautious and balanced strategies produced mildly negative returns (ranging from -0.94% to -0.13%), whilst growth, adventurous and max growth were positive (+0.05% to +0.48%). The diversified strategies benefitted from an underweight to bonds and overweight to alternative investments, however our underweight to technology and overweight to Europe did cost us some relative across strategies.

Equities

Equity markets may have produced a solid return in aggregate, but look under the bonnet, there was a wide dispersion of returns between sectors. The oil majors rallied strongly on further Middle Eastern oil supply shocks, and the technology sector flew on the wings of reassuringly strong Q2 earnings reporting. The healthcare sector also benefitted from its safe haven status, and relatively lower sensitivity to interest rates. By contrast more cyclical sectors, materials and industrials slipped on growth concerns, and the interest-rate sensitive real-estate and utilities sectors, typically with a higher debt burden and longer duration assets, fell sharply.

Bonds

Rising interest rate expectations are an anathema to bond markets, and we witnessed a broad-based sell off in both government and corporate bonds over the quarter. High and rising oil prices are inflationary, and central banks have started to act to keep inflation in check by raising rates to subdue demand in their economies. Core inflation (ex-energy prices) is more subdued but still above target, and the concern is that persistently higher oil prices seep into goods and services costs and stoke wage inflation.

Alternative Assets

The broad commodities index was up strongly over the quarter. Whilst largely driven by the significant rise in the oil price, copper (electrification theme) and gold (uncertainty hedge) also rose. Macro and CTA hedge fund strategies tended to outperform over the quarter, and posted mildly positive returns in aggregate, as one would hope.

Healthcare Allocation rationale

Why Healthcare? What the fund manager says:

Despite the sector's recent recovery, healthcare valuations remain at a discount to the broader market following several years of relative underperformance, a starting point that has historically been associated with attractive long-term relative returns. The near-term environment is also becoming more supportive, with earnings revisions improving and the prospect of greater legislative gridlock in the US reducing the risk of significant healthcare reform, allowing company fundamentals to play a greater role in driving returns.

Looking ahead, we believe the setup for healthcare is improving. While market leadership remains concentrated, recent performance suggests investors are beginning to look beyond the AI-driven market leaders that have dominated returns in recent years. • Whether through the benefits of AI diffusing beyond the initial beneficiaries or a macroeconomic slowdown that increases demand for quality compounders, we believe healthcare is well positioned in either scenario, combining resilient earnings growth, lower volatility and durable demand tailwinds. Although short-term sentiment may remain volatile, we believe the sector remains attractively positioned for long-term investors.

What we say:

This is a blended style large cap fund, focusing on finding exceptional businesses at a good price rather than the next success, which the managers believe is more binary and therefore inherently riskier. We like the alternative focus on profitability and return on invested capital which differentiates it from its peers. More broadly we believe healthcare remains fundamentally attractive with improving momentum. The sector trades at a discount and offers defensive earnings stability. Innovation in biotech and strong balance sheets support our positive stance. Longer term the healthcare sector will benefit from shifting demographics: greater longevity and a higher old-age dependency ratio.

IMPORTANT information

For investment professionals only – not for client use

Always remind your clients that the value of investments and the income derived from it can go down as well as up and investors can get back less than they originally invested. Past performance is not a guide to the future.

Funds which invest in specific sectors may carry more risk than those spread across a number of different sectors. In particular, gold, technology and other focused funds can suffer as the underlying stocks can be more volatile and less liquid.

Bonds issued by major governments and companies will be more stable than those issued by emerging markets or smaller corporate issuers; in the event of an issuer experiencing financial difficulty, there may be a risk to some or all of the capital invested. Please note that historical or current yields should not be considered a reliable indicator of future performance.

Targeted absolute return funds do not guarantee a positive return and you could get back less than you invested, much like any other investment. Additionally, the underlying assets of targeted absolute return funds generally use complex hedging techniques through the use of derivative products.

Due to their nature, specialist funds can be subject to specific sector risks. Investors should ensure they read all relevant information in order to understand the nature of such investments and the specific risks involved.

Different funds carry varying levels of risk depending on the geographical region and industry sector in which they invest. You should make yourself aware of these specific risks prior to investing.
